Figure 2.1. AHRS\_voter

## 2.1. Description

This model implements a voting algorithm for three AHRS. Depending on the number of valid AHRS, the system will provide a mid value, an average value or a single value.

## 2.2. Interface

### 2.2.1. Input Signals

Table 2.1.

Description:

Data Type: AHRS\_Bus

Width: 1

Dimensions: [1 1 ]

### **Table 2.2.**

Description:

Data Type: AHRS\_Bus

Width: 1

Dimensions: [1 1 ]

### **Table 2.3.**

Description:

Data Type: AHRS\_Bus

Width: 1

Dimensions: [1 1 ]

## **2.2.2. Output Signals**

### **Table 2.4.**

Description:

Data Type: double

Width: 5

Dimensions: [1 5 ]

## **2.3. Blocks**

### **2.3.1. Parameters**

#### **2.3.1.1. "AHRS1" (Inport)**

**Table 2.5. "AHRS1" Parameters**

<b>Parameter</b>	<b>Value</b>
Port number	1
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	[]
Maximum	[]
Data type	Bus: AHRS_Bus

### 2.3.1.2. "AHR2" (Inport)

**Table 2.6. "AHR2" Parameters**

Parameter	Value
Port number	2
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	[]
Maximum	[]
Data type	Bus: AHR2_Bus

### 2.3.1.3. "AHR3" (Inport)

**Table 2.7. "AHR3" Parameters**

Parameter	Value
Port number	3
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	0.01
Minimum	[]
Maximum	[]
Data type	Bus: AHR3_Bus

### 2.3.1.4. "BusSelector" (BusSelector)

**Table 2.8. "BusSelector" Parameters**

Parameter	Value
Output signals	theta,phi,r,q,p,valid
Output as virtual bus	off
	theta phi psi q p r

Parameter	Value
	valid

### Output Hierarchy:

1. *BusSelector*
  1. <theta>
  2. <phi>
  3. <r>
  4. <q>
  5. <p>
  6. <valid>

## 2.3.1.5. "BusSelector1" (BusSelector)

**Table 2.9. "BusSelector1" Parameters**

Parameter	Value
Output signals	theta,phi,r,q,p,valid
Output as virtual bus	off
	theta phi psi q p r valid

### Output Hierarchy:

1. *BusSelector1*
  1. <theta>
  2. <phi>
  3. <r>
  4. <q>
  5. <p>
  6. <valid>

## 2.3.1.6. "BusSelector2" (BusSelector)

**Table 2.10. "BusSelector2" Parameters**

Parameter	Value
Output signals	theta,phi,r,q,p,valid
Output as virtual bus	off
	theta phi

Parameter	Value
	psi q p r valid

### Output Hierarchy:

#### 1. *BusSelector2*

1. <theta>
2. <phi>
3. <r>
4. <q>
5. <p>
6. <valid>

## 2.3.1.7. "Constant" (Constant)

**Table 2.11. "Constant" Parameters**

Parameter	Value
Constant value	[0 0 0 0 0]
Interpret vector parameters as 1-D	on
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit from 'Constant value'
Lock output data type setting against changes by the fixed-point tools	off
Sample time	inf
Frame period	inf

## 2.3.1.8. "MultiportSwitch" (MultiPortSwitch)

**Table 2.12. "MultiportSwitch" Parameters**

Parameter	Value
Data port order	Zero-based contiguous
Number of data ports	4
Data port indices (e.g. {1,[2,3]})	{1,2,3}

Parameter	Value
Data port for default case	Last data port
Diagnostic for default case	None
Require all data port inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off
Sample time (-1 for inherited)	-1
Allow different data input sizes (Results in variable-size output signal)	off

### 2.3.1.9. "Mux" (Mux)

**Table 2.13. "Mux" Parameters**

Parameter	Value
Number of inputs	5
Display option	bar

### 2.3.1.10. "Mux1" (Mux)

**Table 2.14. "Mux1" Parameters**

Parameter	Value
Number of inputs	5
Display option	bar

### 2.3.1.11. "Mux2" (Mux)

**Table 2.15. "Mux2" Parameters**

Parameter	Value
Number of inputs	5
Display option	bar

### 2.3.1.12. "Sum" (Sum)

**Table 2.16. "Sum" Parameters**

Parameter	Value
Icon shape	rectangular
List of signs	+++
Sum over	All dimensions
Dimension	1
Require all inputs to have the same data type	off
Accumulator data type	Inherit: Inherit via internal rule
Output minimum	[]
Output maximum	[]
Output data type	uint32
Lock data type settings against changes by the fixed-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off
Sample time (-1 for inherited)	-1

### 2.3.1.13. "voted\_fb" (Outport)

**Table 2.17. "voted\_fb" Parameters**

Parameter	Value
Port number	1
Icon display	Port number

Parameter	Value
Minimum	[]
Maximum	[]
Data type	Inherit: auto
Lock output data type setting against changes by the fixed-point tools	off
Output as nonvirtual bus in parent model	off
Unit (e.g., m, m/s <sup>2</sup> , N*m)	inherit
Port dimensions (-1 for inherited)	-1
Variable-size signal	Inherit
Sample time (-1 for inherited)	-1
Ensure outputport is virtual	off
Source of initial output value	Dialog
Output when disabled	held
Initial output	[]
MustResolveToSignalObject	off
Specify output when source is unconnected	off
Constant value	0
Interpret vector parameters as 1-D	off

## 2.3.2. Block Execution Order

"AHRS\_voter" is a multitasking model. Block execution order is not available for multitasking models.

MustResolveToSignalObject	off
Specify output when source is unconnected	off
Constant value	0
Interpret vector parameters as 1-D	off

### 3.2.2.1.5. "MinMax" (MinMax)

**Table 3.29. "MinMax" Parameters**

Parameter	Value
Function	min
Number of input ports	2
Require all inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off

Parameter	Value
Integer rounding mode	Floor
Saturate on integer overflow	off
Enable zero-crossing detection	on
Sample time (-1 for inherited)	-1

### 3.2.2.1.6. "MinMax1" (MinMax)

**Table 3.30. "MinMax1" Parameters**

Parameter	Value
Function	min
Number of input ports	2
Require all inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off
Enable zero-crossing detection	on
Sample time (-1 for inherited)	-1

### 3.2.2.1.7. "MinMax2" (MinMax)

**Table 3.31. "MinMax2" Parameters**

Parameter	Value
Function	min

Parameter	Value
Number of input ports	2
Require all inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off
Enable zero-crossing detection	on
Sample time (-1 for inherited)	-1

### 3.2.2.1.8. "MinMax3" (MinMax)

**Table 3.32. "MinMax3" Parameters**

Parameter	Value
Function	max
Number of input ports	3
Require all inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off

Parameter	Value
Enable zero-crossing detection	on
Sample time (-1 for inherited)	-1

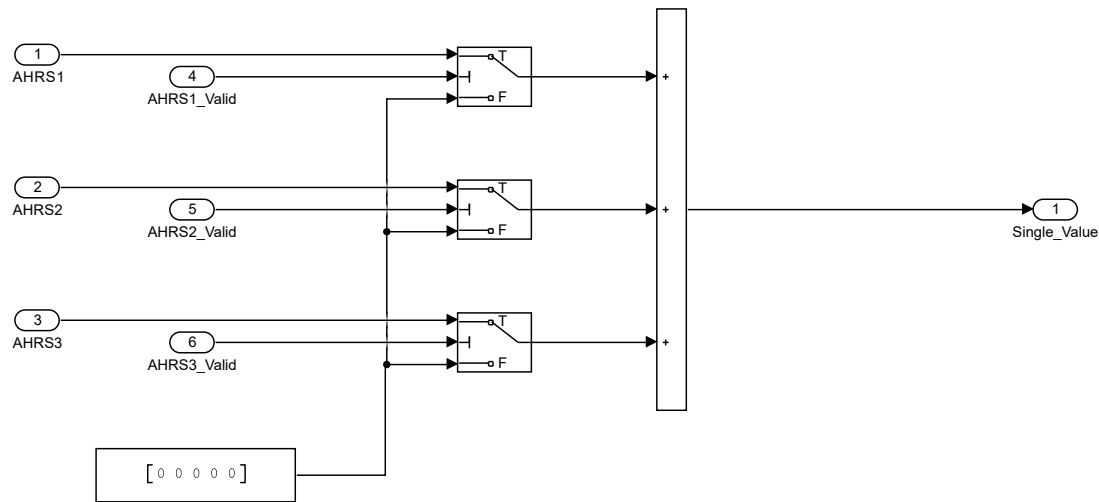

### 3.2.3. Block Execution Order

"AHRS\_voter" is a multitasking model. Block execution order is not available for multitasking models.

## 3.3. Single\_Value

Checksum: 883295405 4047727563 3300040443 1206938375

Figure 3.3. AHRS\_voter/Single\_Value

### 3.3.1. Interface

#### 3.3.1.1. Input Signals

The following tables describe external signals used to compute the subsystem's inputs. The name of the input signal is the name of the input port that accepts the signal. The number in angle brackets is the number of the input port. A dimension of [1 1] indicates a scalar signal.

Table 3.33.

Description:  
Data Type: double  
Width: 5  
Dimensions: [1 5]

**Table 3.34.**

Description:  
Data Type: boolean  
Width: 1  
Dimensions: [1 1 ]

**Table 3.35.**

Description:  
Data Type: double  
Width: 5  
Dimensions: [1 5 ]

**Table 3.36.**

Description:  
Data Type: boolean  
Width: 1  
Dimensions: [1 1 ]

**Table 3.37.**

Description:  
Data Type: double  
Width: 5  
Dimensions: [1 5 ]

**Table 3.38.**

Description:  
Data Type: boolean  
Width: 1  
Dimensions: [1 1 ]

**3.3.1.2. Output Signals**

The following tables describe the signals output by this system. The name of the output signal is the name of the signal's parent block, i.e., the block that computes the signal. The number in angle brackets is the number of the port that emits the signal.

**Table 3.39.**

Description:  
Data Type: double  
Width: 5  
Dimensions: [1 5 ]

## 3.3.2. Blocks

### 3.3.2.1. Parameters

#### 3.3.2.1.1. "AHRs1" (Inport)

**Table 3.40. "AHRs1" Parameters**

Parameter	Value
Port number	1
Port dimensions (-1 for inherited)	-1
Sample time (-1 for inherited)	-1
Minimum	[]
Maximum	[]
Data type	Inherit: auto

#### 3.3.2.1.2. "AHRs1\_Valid" (Inport)

**Table 3.41. "AHRs1\_Valid" Parameters**

Parameter	Value
Port number	4
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	-1
Minimum	[]
Maximum	[]
Data type	boolean

#### 3.3.2.1.3. "AHRs2" (Inport)

**Table 3.42. "AHRs2" Parameters**

Parameter	Value
Port number	2
Port dimensions (-1 for inherited)	-1
Sample time (-1 for inherited)	-1

Parameter	Value
Minimum	[]
Maximum	[]
Data type	Inherit: auto

#### 3.3.2.1.4. "AHR2\_Valid" (Inport)

**Table 3.43. "AHR2\_Valid" Parameters**

Parameter	Value
Port number	5
Port dimensions (-1 for inherited)	1
Sample time (-1 for inherited)	-1
Minimum	[]
Maximum	[]
Data type	boolean

#### 3.3.2.1.5. "AHR3" (Inport)

**Table 3.44. "AHR3" Parameters**

Parameter	Value
Port number	3
Port dimensions (-1 for inherited)	-1
Sample time (-1 for inherited)	-1
Minimum	[]
Maximum	[]
Data type	Inherit: auto

#### 3.3.2.1.6. "AHR3\_Valid" (Inport)

**Table 3.45. "AHR3\_Valid" Parameters**

Parameter	Value
Port number	6
Port dimensions (-1 for inherited)	1

Parameter	Value
Sample time (-1 for inherited)	-1
Minimum	[]
Maximum	[]
Data type	boolean

### 3.3.2.1.7. "Constant" (Constant)

**Table 3.46. "Constant" Parameters**

Parameter	Value
Constant value	[0 0 0 0 0]
Interpret vector parameters as 1-D	on
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit from 'Constant value'
Lock output data type setting against changes by the fixed-point tools	off
Sample time	inf
Frame period	inf

### 3.3.2.1.8. "Single\_Value" (Outport)

**Table 3.47. "Single\_Value" Parameters**

Parameter	Value
Port number	1
Icon display	Port number
Minimum	[]
Maximum	[]
Data type	Inherit: auto
Lock output data type setting against changes by the fixed-point tools	off
Output as nonvirtual bus in parent model	off
Unit (e.g., m, m/s <sup>2</sup> , N*m)	inherit

Parameter	Value
Port dimensions (-1 for inherited)	-1
Variable-size signal	Inherit
Sample time (-1 for inherited)	-1
Ensure outputport is virtual	off
Source of initial output value	Dialog
Output when disabled	held
Initial output	[]
MustResolveToSignalObject	off
Specify output when source is unconnected	off
Constant value	0
Interpret vector parameters as 1-D	off

### 3.3.2.1.9. "Sum" (Sum)

**Table 3.48. "Sum" Parameters**

Parameter	Value
Icon shape	rectangular
List of signs	+++
Sum over	All dimensions
Dimension	1
Require all inputs to have the same data type	off
Accumulator data type	Inherit: Inherit via internal rule
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock data type settings against changes by the fixed-point tools	off
Integer rounding mode	Floor

Parameter	Value
Saturate on integer overflow	off
Sample time (-1 for inherited)	-1

### 3.3.2.1.10. "Switch" (Switch)

**Table 3.49. "Switch" Parameters**

Parameter	Value
Criteria for passing first input	u2 ~= 0
Threshold	0
Require all data port inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off
Enable zero-crossing detection	on
Sample time (-1 for inherited)	-1
Allow different data input sizes (Results in variable-size output signal)	off

### 3.3.2.1.11. "Switch1" (Switch)

**Table 3.50. "Switch1" Parameters**

Parameter	Value
Criteria for passing first input	u2 ~= 0

Parameter	Value
Threshold	0
Require all data port inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off
Integer rounding mode	Floor
Saturate on integer overflow	off
Enable zero-crossing detection	on
Sample time (-1 for inherited)	-1
Allow different data input sizes (Results in variable-size output signal)	off

### 3.3.2.1.12. "Switch2" (Switch)

**Table 3.51. "Switch2" Parameters**

Parameter	Value
Criteria for passing first input	$u2 \approx 0$
Threshold	0
Require all data port inputs to have the same data type	off
Output minimum	[]
Output maximum	[]
Output data type	Inherit: Inherit via internal rule
Lock output data type setting against changes by the fixed-point tools	off
Integer rounding mode	Floor

Parameter	Value
Saturate on integer overflow	off
Enable zero-crossing detection	on
Sample time (-1 for inherited)	-1
Allow different data input sizes (Results in variable-size output signal)	off

### 3.3.3. Block Execution Order

"AHRS\_voter" is a multitasking model. Block execution order is not available for multitasking models.

# Chapter 7. Glossary

**Atomic Subsystem.** A subsystem treated as a unit by an implementation of the design documented in this report. The implementation computes the outputs of all the blocks in the atomic subsystem before computing the next block in the parent system's block execution order (sorted list).

**Block Diagram.** A Simulink block diagram represents a set of simultaneous equations that relate a system or subsystem's inputs to its outputs as a function of time. Each block in the diagram represents an equation of the form  $y = f(t, x, u)$  where  $t$  is the current time,  $u$  is a block input,  $y$  is a block output, and  $x$  is a system state (see the Simulink documentation for information on the functions represented by the various types of blocks that make up the diagram). Lines connecting the blocks represent dependencies among the blocks, i.e., inputs whose current values are the outputs of other blocks. An implementation of a design described in this document computes a root or atomic system's outputs at each time step by computing the outputs of the blocks in an order determined by block input/output dependencies.

**Block Parameter.** A variable that determines the output of a block along with its inputs, for example, the gain parameter of a Gain block.

**Block Execution Order.** The order in which Simulink evaluates blocks during simulation of a model. The block execution order determined by Simulink ensures that a block executes only after all blocks on whose outputs it depends are executed.

**Checksum.** A number that indicates whether different versions of a model or atomic subsystem differ functionally or only cosmetically. Different checksums for different versions of the same model or subsystem indicate that the versions differ functionally.

**Design Variable.** A symbolic (MATLAB) variable or expression used as the value of a block parameter. Design variables allow the behavior of the model to be altered by altering the value of the design variable.

**Signal.** A block output, so-called because block outputs typically vary with time.

**Virtual Subsystem.** A subsystem that is purely graphical, i.e., is intended to reduce the visual complexity of the block diagram of which it is a subsystem. An implementation of the design treats the blocks in the subsystem as part of the first nonvirtual ancestor of the virtual subsystem (see Atomic Subsystem).

# Chapter 8. About this Report

## Table of Contents

8.1. Report Overview .....	80
8.2. Root System Description .....	80
8.3. Subsystem Descriptions .....	81
8.4. State Chart Descriptions .....	81

## 8.1. Report Overview

This report describes the design of the AHRS\_voter system. The report was generated automatically from a Simulink model used to validate the design. It contains the following sections:

**Model Version.** Specifies information about the version of the model from which this design description was generated. Includes the model checksum, a number that indicates whether different versions of the model differ functionally or only cosmetically. Different checksums for different versions indicate that the versions differ functionally.

**Root System.** Describes the design's root system.

**Subsystems.** Describes each of the design's subsystems.

**Design Variables.** Describes system design variables, i.e., MATLAB variables and expressions used as block parameter values.

**System Model Configuration.** Lists the configuration parameters, e.g., start and stop time, of the model used to simulate the system described by this report.

**Requirements.** Shows design requirements associated with elements of the design model. This section appears only if the design model contains requirements links.

**Glossary.** Defines Simulink terms used in this report.

## 8.2. Root System Description

This section describes a design's root system. It contains the following sections:

**Diagram.** Simulink block diagram that represents the algorithm used to compute the root system's outputs.

**Description.** Description of the root system. This section appears only if the model's root system has a Documentation property or a Doc block.

**Interface.** Name, data type, width, and other properties of the root system's input and output signals. The number of the block port that outputs the signal appears in angle brackets appended to the signal name. This section appears only if the root system has input or output ports.

**Blocks.** This section has two subsections:

- **Parameters.** Describes key parameters of blocks in the root system. This section also includes graphical and/or tabular representations of lookup table data used by lookup table blocks, i.e., blocks that use lookup tables to compute their outputs.
- **Block Execution Order.** Order in which blocks must be executed at each time step in order to ensure that each block's inputs are available when it executes.

**State Charts.** Describes state charts used in the root system. This section appears only if the root system contains Stateflow blocks.

## 8.3. Subsystem Descriptions

This section describes a design's subsystems. Each subsystem description contains the following sections:

**Checksum.** This section appears only if the subsystem is an atomic subsystem. The checksum indicates whether the version of the model subsystem used to generate this report differs functionally from other versions of the model subsystem. If two model checksums differ, the corresponding versions of the model differ functionally.

**Diagram.** Simulink block diagram that graphically represents the algorithm used to compute the subsystem's outputs.

**Description.** Description of the subsystem. This section appears only if the subsystem has a Documentation property or contains a Doc block.

**Interface.** Name, data type, width, and other properties of the subsystem's input and output signals. The number of the block port that outputs the signal appears in angle brackets appended to the signal name. This section appears only if the subsystem is atomic and has input or output ports.

**Blocks.** Blocks that this subsystem contains. This section has two subsections:

- **Parameters.** Key parameters of blocks in the subsystem. This section also includes graphical and/or tabular representations of lookup table data used by lookup table blocks, blocks that use lookup tables to compute their outputs.
- **Block Execution Order.** Order in which the subsystem's blocks must be executed at each time step in order to ensure that each block's inputs are available when the block executes. This section appears only if the subsystem is atomic. Note: in Acrobat(PDF) reports, the number in square brackets next to the block name is a hyperlink to the block parameter table. The number has no model significance.

**State Charts.** Describes state charts used in the subsystem. This section appears only if the root system contains Stateflow blocks.

## 8.4. State Chart Descriptions

This section describes the state machines used by Stateflow blocks to compute their outputs, i.e., Stateflow blocks. Each state machine description contains the following sections:

**Chart.** Diagram representing the state machine.

**States.** Describes the state machine's states. Each state description includes the state's diagram and diagrams and/or descriptions of graphical functions, Simulink functions, truth tables, and MATLAB functions parented by the state.

**Transitions.** Transitions between the state machine's states. Each transition description specifies the values of key transition properties. Appears only if a transition has properties that do not appear on the chart.

**Junctions.** Transition junctions. Each junction description specifies the values of key junction properties. Appears only if a junction has properties that do not appear on the chart.

**Events.** Events that trigger state transitions. Each event description specifies the values of key event properties.

**Data.** Data types and other properties of the Stateflow block's inputs, outputs, and other state machine data.

**Targets.** Executable implementations of the state machine used to compute the outputs of the corresponding Stateflow block.

**MATLAB Supporting Functions.** List of functions invoked by MATLAB functions defined in the chart.
